

HostelOps

AI-Powered Operations Manager for PG and Hostel Owners

5-Minute Product Demo Video Script

AWS 'Agents for Humans' Hackathon

Project:	HostelOps
Tagline:	An AI-powered operations manager for PG and hostel owners
Duration:	5 minutes (300 seconds)
Format:	Product demo with screen recording + narration
Target:	AWS Agents for Humans Hackathon Judges
Tech Stack:	React + TypeScript, Python, FastAPI, Strands Agents SDK, Amazon Bedrock, MySQL, AWS

Production-Ready Script with Timestamps, Visual Direction, and Voiceover

Total Duration: 5:00 | Narration: ~2:30 | Visuals: ~5:00

Table of Contents

1. Video Overview & Structure
2. Master Script Table (Timestamps)
3. Section-by-Section Breakdown
4. Full Voiceover Script
5. Screen-Recording Checklist
6. Assets Required
7. Editing Checklist
8. YouTube Title & Description

1. Video Overview & Structure

Objective

Create a 5-minute product demo video for the AWS 'Agents for Humans' Hackathon that clearly demonstrates HostelOps as a REAL AI AGENT performing actual work -- not just a chatbot. The video must showcase agentic behavior, real-world actions, human-in-the-loop approval, AWS/Bedrock integration, and the Strands Agents SDK.

Target Users

PG owners, Hostel owners, Small accommodation operators, Property/Hostel managers

Video Structure

TIMESTAMP	DUR	SECTION	DESCRIPTION
00:00 - 00:20	20s	Hook	Show the problem: too many manual tasks
00:20 - 00:40	20s	Introduce HostelOps	Present the AI operations manager
00:40 - 01:00	20s	Why It Is An Agent	Explain agent architecture
01:00 - 01:15	15s	Start Real Demo	Type the actual request
01:15 - 01:40	25s	Understand + Identify	Agent parses request, finds tenant/room
01:40 - 02:05	25s	Create + Classify	Complaint created and categorized
02:05 - 02:35	30s	Vendor Discovery	Search, compare, recommend vendors
02:35 - 03:00	25s	AI Recommendation	Show recommendation with reasoning
03:00 - 03:25	25s	Human Approval	Owner clicks APPROVE (key moment)
03:25 - 03:55	30s	Execute Actions	Job created, vendor assigned, tenant notified
03:55 - 04:15	20s	Activity Log	Show audit trail of all actions
04:15 - 04:35	20s	Architecture	Technical stack overview
04:35 - 04:50	15s	What Makes It Different	Key differentiators montage
04:50 - 05:00	10s	Closing	Final impact and branding

Total Duration Breakdown

Total Video: 5 minutes 00 seconds (300 seconds)

Total Narration: ~2 minutes 30 seconds (moderate pace, ~310 words)

Visual Breathing Room: ~2 minutes 30 seconds (pauses, transitions, screen recording)

2. Master Script Table

00:00 - 00:05 5s	
SCREEN/VISUAL:	
HostelOps dashboard fades in from black. Clean, polished UI with sidebar nav, room grid, and stats.	PRES
No action. Let the dashboard breathe.	
(Silence -- let visuals speak)	VOICE
HostelOps (subtle, bottom-right corner)	TEXT
Soft fade-in from black. Light ambient hum.	TRAN
00:05 - 00:20 15s	
SCREEN/VISUAL:	
Dashboard static. Cursor slowly pans across Rooms, Tenants, Complaints, Vendors sections.	PRES
Cursor moves naturally across dashboard sections, pausing briefly on each.	VOICE
Managing a PG or hostel means dealing with dozens of small operational tasks every day. A tenant reports a problem. A vendor needs to be found. Approval is required. Work needs to be assigned. And the tenant needs an update.	TEXT
Too many manual operational tasks. (appears at 00:12)	TRAN
Subtle zoom-in on dashboard. Calm background music fades in softly.	
00:20 - 00:30 10s	
SCREEN/VISUAL:	
HostelOps logo centered on screen, then dissolve to full dashboard view. Show sidebar with all modules visible.	PRES
Presenter highlights sidebar modules: Rooms, Tenants, Complaints, Vendors, Maintenance, Approvals, AI Activity.	VOICE
HostelOps is an AI-powered operations manager built for PG and hostel owners.	TEXT
HostelOps -- AI Operations Manager	TRAN
Smooth dissolve from logo to dashboard.	

00:30 - 00:40 | 10s

SCREEN/VISUAL:

Dashboard in background. Subtle zoom into the AI chat interaction area.

Cursor hovers over the AI interaction section.

Instead of simply answering questions, it can understand an operational request and coordinate the work required to complete it.

(None)

Gentle zoom into AI section. Music remains soft.

00:40 - 00:52 | 12s

SCREEN/VISUAL:

Split view: Left -- AI chat area. Right -- Architecture diagram showing React > FastAPI > Strands Agent > Bedrock > Tools > MySQL. Each layer highlights sequentially.

Cursor traces the architecture path as each layer is mentioned.

HostelOps is powered by the Strands Agents SDK and Amazon Bedrock. The agent can reason about a request, select the tools it needs, interact with operational data, take actions, and involve the owner when human approval is required.

Understand > Plan > Use Tools > Act > Verify

Architecture layers illuminate one by one. Subtle tech sound effect per layer.

00:52 - 01:00 | 8s

SCREEN/VISUAL:

Back to full dashboard. Cursor navigates to the AI agent chat interface.

Presenter clicks into the AI agent input field.

Let's see this in action.

Real Demo Starts Now (brief flash)

Clean cut to AI interface. Music dips slightly.

01:00 - 01:15 | 15s

SCREEN/VISUAL:

AI chat input field. Presenter types the exact request. Text appears character by character: 'Room 12 ka tap leak ho raha hai. Rahul tenant hai.' Submit button is clicked. Brief pause.

Presenter types the full message, clicks Send/Submit. 2-second pause after submission to let judge see the request.

A tenant reports a leaking tap in Room 12. Let's send this to the agent.

Room 12 ka tap leak ho raha hai. Rahul tenant hai. (mirrored on screen as typed)

Typing SFX (subtle). Pause creates anticipation.

01:15 - 01:25 | 10s

SCREEN/VISUAL:

Agent processing indicator (spinner or thinking state). Then results appear: Rahul identified with tenant details. Room 12 identified with room details.

Cursor highlights 'Rahul' and 'Room 12' as they appear in the agent response.

The agent first understands the request and retrieves the relevant tenant and room information.

1. Understand request (checkmark)

Smooth animation as results populate.

01:25 - 01:40 | 15s

SCREEN/VISUAL:

Agent response continues. Shows: Rahul -- Tenant ID, Room Number, Contact, Status. Room 12 -- Type, Floor, Status. Agent confirms understanding.

Presenter scrolls through the retrieved data. Highlights key fields.

It identifies Rahul and connects the request to Room 12. The agent now has the context it needs to proceed.

2. Identify tenant (checkmark) | 3. Identify room (checkmark)

Subtle scroll animation. Data cards appear sequentially.

01:40 - 01:52 | 12s

SCREEN/VISUAL:

Agent creates a maintenance complaint. Complaint card appears with: Complaint ID, Room 12, Rahul, Category: Plumbing/Maintenance, Priority, Status: Open.

Presenter highlights the complaint card, showing all fields.

It then creates a structured maintenance complaint and classifies the issue so the correct operational workflow can begin.

Complaint created (checkmark) | Issue classified (checkmark)

Complaint card animates into view. Soft confirmation sound.

01:52 - 02:05 | 13s

SCREEN/VISUAL:

Agent searches for vendors. Vendor list appears. Show actual vendor names, specialties, ratings, and pricing from the application.

Presenter scrolls through vendor results. Highlights 2-3 vendors.

Next, the agent searches for suitable vendors and compares the available options. This removes one of the repetitive tasks that hostel owners normally have to handle manually.

Search vendors (checkmark) | Compare options (checkmark)

Vendor cards appear in sequence. Subtle data-loading effect.

02:05 - 02:20 | 15s

SCREEN/VISUAL:

Vendor comparison view. Show 2-3 vendors side by side: Name, Specialty, Rating, Estimated Cost, Availability. Agent highlights the recommended vendor with a reason.

Presenter points to the recommended vendor. Shows comparison data.

The agent compares pricing, ratings, and availability -- then recommends the best option for this specific job.

Recommend best option (checkmark)

Comparison cards animate in. Recommendation card glows or highlights.

02:20 - 02:35 | 15s

SCREEN/VISUAL:

AI Recommendation card prominently displayed. Shows: Recommended Vendor Name, Estimated Cost, Reason, Complaint Reference.

Presenter pauses on the recommendation card.

Based on the available information, the agent recommends an appropriate option. But automation does not mean removing the owner from important decisions.

AI Recommendation (top) | Human control remains in the loop. (bottom)

Recommendation card centered. Brief dramatic pause in narration. Music softens.

02:35 - 02:48 | 13s

SCREEN/VISUAL:

Approval screen appears. Clean, prominent modal/card: MAINTENANCE APPROVAL -- Room: 12, Issue: Leaking Tap, Vendor: [actual vendor name], Estimated Cost: [actual amount]. Two buttons: [APPROVE] [REJECT].

Presenter hovers over the APPROVE button. Pause for 2 seconds to let the judge read the approval card.

Before creating the maintenance commitment, HostelOps asks the owner for approval.

APPROVAL REQUIRED

Approval modal fades in. Subtle tension sound or silence for impact.

02:48 - 03:00 | 12s

SCREEN/VISUAL:

Presenter clicks the APPROVE button. Button changes to 'Approved' with a checkmark. Agent acknowledges approval and begins execution.

Presenter clicks APPROVE. Visual confirmation appears.

Once approved, the agent continues the workflow automatically.

Approved (checkmark) | Agent continuing...

Click SFX. Satisfying confirmation animation. Music resumes gently.

03:00 - 03:12 | 12s

SCREEN/VISUAL:

Agent executes actions. Status cards appear sequentially: Maintenance job created (Job ID shown), Vendor assigned (Vendor name shown), Complaint status updated to 'In Progress'.

Presenter highlights each status update as it appears.

After approval, the agent creates the maintenance job, assigns the vendor, and updates the complaint.

Maintenance job created (checkmark) | Vendor assigned (checkmark) | Complaint updated (checkmark)

Status cards cascade in. Each gets a soft checkmark sound.

03:12 - 03:25 | 13s

SCREEN/VISUAL:

Final action: Tenant notification sent. Notification card shows: Sent to Rahul, Room 12, Message content preview, Timestamp. Activity log updates.

Presenter shows the notification card and scrolls to activity log.

And finally, it sends a notification to the tenant -- Rahul -- letting him know help is on the way.

Tenant notified (checkmark) | Workflow complete (checkmark)

Notification card animates. Activity log populates. Gentle completion chime.

03:25 - 03:40 | 15s

SCREEN/VISUAL:

Navigate to AI Activity / Activity Log section. Show the full sequence of actions logged: timestamps, actions taken, tools used, outcomes.

Presenter scrolls through the activity log, highlighting key entries.

Every important step is recorded in the activity history, giving the owner full visibility into what the agent did and when.

Transparent AI actions | Operational history

Smooth scroll through log entries. Each entry highlights as mentioned.

03:40 - 03:55 | 15s

SCREEN/VISUAL:

Architecture diagram shown cleanly. Layers highlighted sequentially: React Frontend > FastAPI Backend > Strands Agent > Amazon Bedrock > Agent Tools > MySQL

Diagram animates layer by layer.

Under the hood, the React dashboard communicates with a FastAPI backend. The Strands agent orchestrates the workflow, Amazon Bedrock provides the foundation model, and modular tools connect the agent to hostel operations and MySQL data.

React > FastAPI > Strands Agent > Bedrock > Tools > MySQL

Architecture layers illuminate with subtle tech SFX per layer.

03:55 - 04:10 | 15s

SCREEN/VISUAL:

Quick montage (2-3s each): AI request typed > Complaint created > Vendors compared > Approval clicked > Maintenance job > Notification sent > Activity log.

Fast cuts between key moments of the demo.

HostelOps is more than a chatbot. It transforms natural-language requests into real operational workflows, uses tools to perform actions, and keeps humans in control when decisions matter.

Not just chat. | Real work.

Quick cuts. Each transition has a subtle whoosh. Music builds slightly.

04:10 - 04:25 | 15s

SCREEN/VISUAL:

Return to polished HostelOps dashboard. Show completed maintenance workflow status. Dashboard looks clean, professional, finalized.

Presenter shows the final state of the dashboard with the completed workflow.

Our vision is simple: give small hostel and PG owners an AI operations team that reduces repetitive work and helps them run better operations.

(None yet)

Smooth transition back to dashboard. Music at calm, confident level.

04:25 - 04:35 | 10s

SCREEN/VISUAL:

Dashboard fades slightly. Final branding appears: HostelOps logo, tagline, and AWS/Strands/Bedrock logos.

No action. Clean final frame.

(Silence -- let the final frame speak)

HostelOps | Smarter operations. Less manual work. | Built with Strands Agents SDK + Amazon Bedrock

Gentle fade to final branding frame. Music fades out softly.

04:35 - 04:50 | 15s

SCREEN/VISUAL:

Final frame holds. QR code or GitHub link if applicable. Hackathon branding.

No action. Hold final frame.

(Silence or very soft ambient)

AWS 'Agents for Humans' Hackathon | github.com/[your-repo]

Hold. Clean fade to black at 04:50.

04:50 - 05:00 | 10s

SCREEN/VISUAL:

Fade to black. Optional: HostelOps wordmark one final time.

(None)

(None)

(None)

Fade to black. Silence.

[16]

"HostelOps is more than a chatbot. It transforms natural-language requests into real operational workflows, uses tools to perform actions, and keeps humans in control when decisions matter."

[17]

"Our vision is simple: give small hostel and PG owners an AI operations team that reduces repetitive work and helps them run better operations."

5. Screen-Recording Checklist

Pre-Recording Setup

- ☐ HostelOps application fully running and seeded with data
- ☐ Room 12 exists and is occupied by Rahul (tenant)
- ☐ At least 2-3 vendors loaded in the vendor database with real names, ratings, pricing
- ☐ AI agent endpoint functional and responsive
- ☐ Browser zoom set to 100%, clean bookmarks bar, no notifications
- ☐ Screen resolution: 1920x1080 (Full HD)
- ☐ Browser window maximized, no desktop icons visible
- ☐ Disable all notifications (OS-level and browser-level)
- ☐ Close all unnecessary tabs and applications
- ☐ Disable popup blockers for the application
- ☐ Ensure cursor is visible and smooth (increase size if needed)

Recording Sequence

- ☐ 01. Dashboard overview -- Full dashboard, static 5 seconds, then slow cursor pan
- ☐ 02. Sidebar modules -- Hover over each: Rooms, Tenants, Complaints, Vendors, Maintenance, Approvals, AI Activity
- ☐ 03. AI chat interface -- Navigate to AI agent input area
- ☐ 04. Type request -- Type exactly: Room 12 ka tap leak ho raha hai. Rahul tenant hai.
- ☐ 05. Submit -- Click Send/Submit, hold for 2 seconds
- ☐ 06. Agent processing -- Capture spinner/thinking state
- ☐ 07. Tenant identified -- Show Rahul's details as returned by agent
- ☐ 08. Room identified -- Show Room 12 details as returned by agent
- ☐ 09. Complaint created -- Show complaint card with ID, room, tenant, category, status
- ☐ 10. Vendor search -- Show vendor list returned by agent (actual names, prices)
- ☐ 11. Vendor comparison -- Show comparison view if available
- ☐ 12. AI recommendation -- Show recommended vendor with reason and cost
- ☐ 13. Approval screen -- Show approval modal/card prominently
- ☐ 14. Click APPROVE -- Capture the click and confirmation
- ☐ 15. Job created -- Show maintenance job with Job ID
- ☐ 16. Vendor assigned -- Show vendor assignment confirmation
- ☐ 17. Complaint updated -- Show updated complaint status
- ☐ 18. Notification sent -- Show tenant notification details
- ☐ 19. Activity log -- Navigate to AI Activity, scroll through full log
- ☐ 20. Final dashboard -- Return to dashboard showing completed workflow

Post-Recording

- ☐ Review recording for any UI glitches or loading delays
- ☐ Check cursor is visible throughout
- ☐ Verify all data shown is real (no placeholder/mock data)
- ☐ Ensure no personal/sensitive data is exposed
- ☐ Confirm text is readable at 1080p

6. Assets Required

Application Assets

- ☐ HostelOps running instance with seed data
- ☐ Room 12 with tenant Rahul (with real tenant details)
- ☐ At least 3 vendors with names, specialties, ratings, pricing
- ☐ Functional AI agent endpoint
- ☐ Working approval workflow
- ☐ Working notification system
- ☐ Activity log populated with agent actions

Video Production Assets

- ☐ Screen recording software (OBS Studio recommended -- free)
- ☐ Microphone (USB condenser or laptop built-in with quiet environment)
- ☐ Video editing software (DaVinci Resolve free, CapCut, or Premiere Pro)
- ☐ Background music (royalty-free tech ambient -- Artlist, Epidemic Sound, or YouTube Audio Library)
- ☐ Architecture diagram image (created for HostelOps)
- ☐ HostelOps logo/wordmark (PNG with transparency)
- ☐ Text overlay templates (consistent font, size, color)
- ☐ Sound effects: typing, click, confirmation chime, subtle whoosh

Brand Assets

- ☐ HostelOps logo (dark + light variants)
- ☐ AWS logo (for hackathon compliance)
- ☐ Strands Agents SDK logo
- ☐ Amazon Bedrock logo
- ☐ Consistent color palette: Primary blue (#1E64C8), Dark (#1E1E2E), Light (#F8FAFC)
- ☐ Font: Inter or system sans-serif for overlays

7. Editing Checklist

Visual Editing

- ☐ Crop/zoom to highlight important UI elements during key moments
- ☐ Add smooth zoom transitions (1.2x-1.5x) on approval screen, recommendation card, and activity log
- ☐ Ensure all text overlays use consistent font, size, and position
- ☐ Text overlays: bottom-center for descriptions, top-left for section labels
- ☐ Remove any loading delays or slow API responses (speed up or cut)
- ☐ Ensure cursor is visible and smooth throughout
- ☐ Add subtle vignette or border to focus attention on center of screen
- ☐ Color grade for consistent, clean look (slightly cool tones for tech feel)

Audio Editing

- ☐ Record voiceover in quiet environment, consistent volume
- ☐ Normalize audio levels (-14 LUFS for YouTube)
- ☐ Background music at -20dB to -25dB relative to voice
- ☐ Reduce music volume during key explanations and approval moment
- ☐ Add subtle sound effects: typing (01:00), click (02:48), confirmation chime (03:12)
- ☐ Ensure no background noise or echo in voiceover
- ☐ Fade music in at 00:05, fade out at 04:35

Pacing & Transitions

- ☐ Hook section (00:00-00:20): Fast enough to grab attention, not rushed
- ☐ Demo section (01:00-03:55): Allow breathing room for judge to read screen
- ☐ Approval moment (02:35-03:00): Slightly slower, dramatic pause before click
- ☐ Architecture (04:15-04:35): Concise, don't linger
- ☐ Montage (03:55-04:10): Quick cuts, energetic
- ☐ Closing (04:50-05:00): Calm, confident, clean fade
- ☐ Use cross-dissolve for major section transitions
- ☐ Use hard cuts within demo sections for continuity

Final Review

- ☐ Total duration is exactly 5:00 or under
- ☐ Voiceover is clear and professional throughout
- ☐ All screen text is readable at 1080p
- ☐ No placeholder/mock data visible
- ☐ Approval click is clearly visible
- ☐ Architecture diagram is legible
- ☐ Music doesn't overpower narration
- ☐ Video starts and ends cleanly
- ☐ No black frames or dead air (except intentional pauses)
- ☐ Export: H.264, 1080p, 30fps, YouTube optimized

8. YouTube Title & Description

YouTube Title (choose one)

HostelOps: AI Operations Manager for PG & Hostel Owners | AWS Agents for Humans Hackathon

HostelOps -- AI Agent That Manages Your Hostel Operations | Hackathon Demo

From Complaint to Resolution: AI Agent Workflow for Hostel Management | HostelOps

YouTube Description

HostelOps is an AI-powered operations manager for PG and hostel owners, built for the AWS "Agents for Humans" Hackathon.

THE PROBLEM:

PG and hostel owners spend hours every day handling tenant complaints, finding vendors, comparing quotes, getting approvals, and tracking operational work. A simple leaking tap can require 6-8 manual steps.

THE SOLUTION:

HostelOps uses an AI agent to turn natural-language requests into complete operational workflows. Just describe the problem, and the agent handles the rest -- while keeping you in control of important decisions.

KEY FEATURES:

- Natural language request processing
- Automated complaint creation and classification
- Vendor search, comparison, and recommendation
- Human-in-the-loop approval workflow
- Automated job creation and vendor assignment
- Tenant notification system
- Complete activity audit log

TECH STACK:

- Frontend: React + TypeScript + Tailwind CSS
- Backend: Python + FastAPI
- AI Agent: Strands Agents SDK
- LLM: Amazon Bedrock (Claude Sonnet)
- Database: MySQL
- Cloud: AWS

HOW IT WORKS:

1. Owner describes a problem in plain language (English or Hinglish)
2. Agent understands the request and identifies relevant entities
3. Agent creates a maintenance complaint and classifies the issue
4. Agent searches for suitable vendors and compares options
5. Agent recommends the best option with reasoning
6. Owner approves or rejects the recommendation
7. Agent executes: creates job, assigns vendor, notifies tenant
8. All actions are logged for transparency

BUILT FOR:

AWS "Agents for Humans" Hackathon
